Learning Objective

As Artificial Intelligence is utilized by the masses in our products and services, the economy and people are poised to change. In this learning exercise, youth will learn how best to equip themselves for this shift, protect themselves from human biases and misinformation, and become empowered to utilize and create new technology for good.

What is Artificial Intelligence (AI)

According to Brookings,¹ modern AI is “machines that respond to stimulation consistent with traditional responses from humans, given the capacity for contemplation, judgment, and intention.” Computers and related software can make decisions that usually require human expertise. AI can have machines that have the intentionality, intelligence, and adaptability that humans have.

Given that the world’s population is set to be close to 9 billion people in the coming decades, AI can help humans create better or fracture society by taking away jobs and skills that ordinarily allowed humans to partake in the economy. With the high level of intelligence that AI can provide, society can move forward to solve problems with the help of AI, or can further fracture and harm each other. The choice is up to you all - the youth. Currently, 41% of the world’s population, about 3.3 billion people, are under 24 (the youth). How you adapt to this new technological revolution (similar to the onset of the internet) will determine the trajectory of the next phase of human existence.
